

ABSTRACT

2 The invention is an assembly that connects prosthetic teeth to dental models. The
3 assembly forms a two part analog pin that snaps into a sleeve. Also disclosed are kits for
4 installing the assembly, dental models that contain the assembly, and methods for making
5 dental models that contain the assembly. The assembly expedites the connection and
6 separation of prosthetic teeth to and from dental modes and can be employed with dry set
7 dowel pins.
